

MoCA Filter Installation – At 1st Splitter

- It is recommended to install the MoCA filter as close as possible to the premise location to avoid the potential for Home to Home interference and to improve in-home receive levels.
- When the in-home MoCA devices communicate with each other via the splitter's output isolation, there is both direct and indirect MoCA communications signal elements.
- These effects are minimized when the MoCA filter is placed at or near the splitter's input such that most all of the MoCA's signals are reflected back to the splitter's output ports.
